

Cable 1 Preparation (Phase)

1. Trim jacket back to the lengths shown at both ends, making sure not to cut braid.
2. Unweave braid back to jacket at both ends of cable. Braid is woven of 16 strands of 8 individual conductors.
3. At both ends of cable twist 10 strands (80 conductors) together and apply clear heatshrink (item 9) to newly formed conductor. Heatshrink should sit the specified strip length for the terminal used from the tip of the conductor. Trim remaining braid flush with cable jacket.
4. Apply black heatshrink (item 10) to both ends over the original green/yellow - this will be referred to as the "black" conductor. Heatshrink should sit the specified strip length for the terminal used from the tip of the conductor.
5. At both ends apply heatshrink (item 7), covering cut ends of jacket and braid.
6. At both ends strip & terminate wires per manufacturers' recommendations and insert into connectors according to tables.

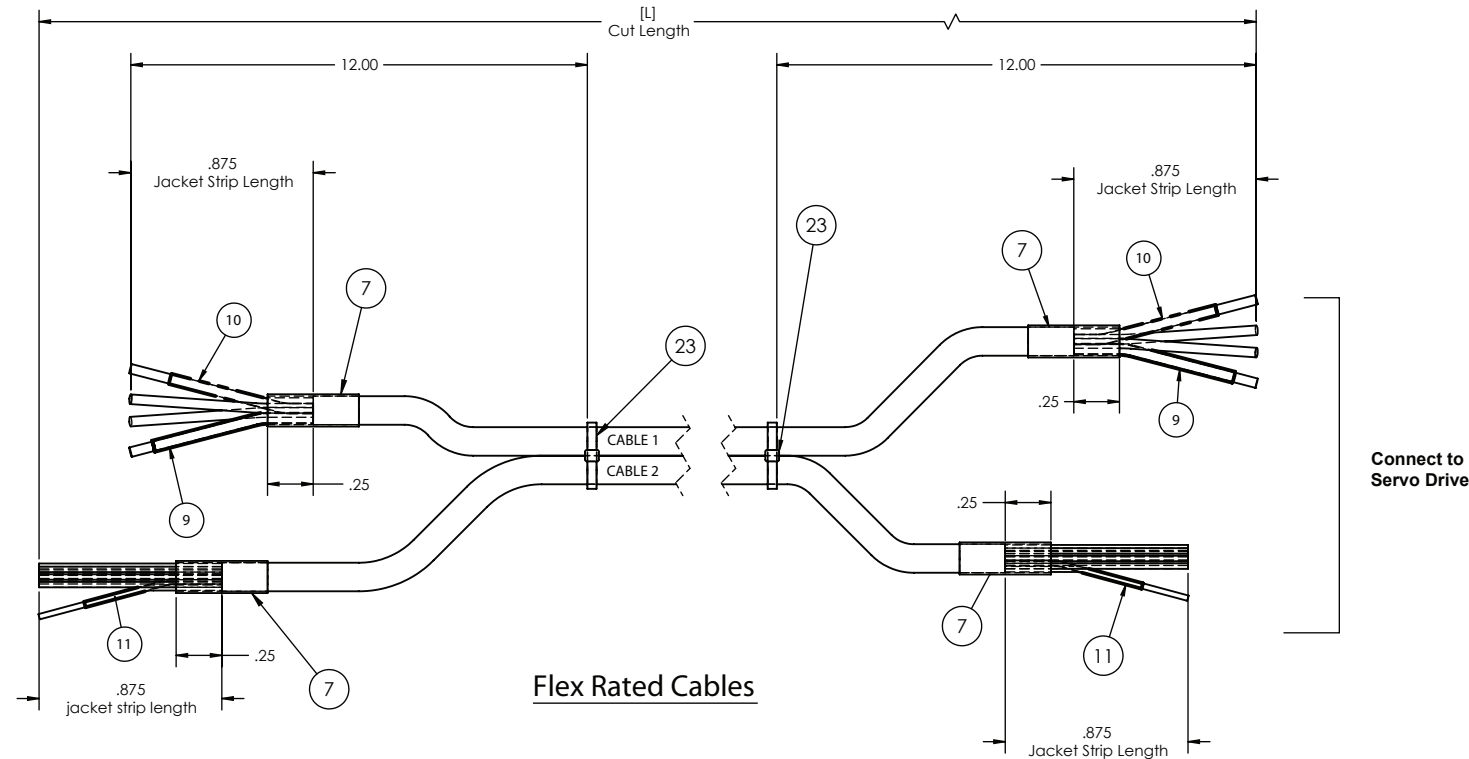

Cable 2 Preparation (Signal)

1. Trim jacket back to the lengths shown at both ends, making sure not to cut braid.
2. Unweave braid back to jacket at both ends of cable. Braid is woven of 15 strands of 5 individual conductors.
3. At both ends of cable twist 5 strands (25 conductors) together and apply clear heatshrink (item 11) to newly formed conductors. Heatshrink should sit the specified strip length for the terminal used from the tip of the conductor. Trim remaining braid flush with cable jacket.
4. At both ends trim grey, pink, brown, and red/blue wires flush with jacket.
5. At both ends apply heatshrink (item 7), covering cut ends of jacket and braid.
6. At both ends strip & terminate wires per manufacturers' recommendations and insert into connectors according to tables.

Test Requirements

1. OPEN
Test all conductors for open circuits.
2. SHORT
Test each conductor for short circuits to all other conductors.
3. HIPOT 1
Connect pins from phase BLK1, BLK2, and BLK conductors together and connect pins from encoder GRN, BLU, BRN/GRN, BLK, GRY/PNK, RED, WHT/GRN, WHT, VIO, YEL.
 - Hipot test between these two groups of conductors @ 2,300 VAC for 10 seconds: leakage current below 250uA with no arcing observed.
4. HIPOT 2
Connect pins from phase BLK1, BLK2, and BLK together.
 - Hipot test between this group of conductors and the CLR conductor from cable 1 @ 1,000 VAC for 10 seconds: leakage current to be below 250uA with no arcing observed.
